

DIR911 INSTANT RECALL RECORDER QUICK REFERENCE GUIDE

MAIN Screen - is where all operations begin. From this screen, the user can record, play, cycle through messages, restore to current message, and check saved messages.

18-May-00 11:45:32	Msg # 001/999
Ready	17 May 00 00:00:00
0000000000000000	Msg Len 00:00:00
RESTORE	PREV MSG NEXT MSG SYSTEM

RESTORE changes the current message to the last recorded message.

PREV MSG (previous message) changes the current message to the one before and starts to play it.
NEXT MSG (next message) changes the current message to the next recorded message and starts to play it.

Both automatically wrap when at the first or last message. Once you have skipped through and selected the message you wish to listen to, pressing the RECALL button moves you into the PLAY screen (see below).

SYSTEM allows you to view system information and/or configure the DIR911.

Ready Unit status can be any of the following messages:

- Ready* - Ready to play/record
- Recording* - Unit is in record mode, recording a new message
- Playing* - Playing current message
- Paused* - Current message paused, play continues
- Paused End* - At the end of the current message

PLAY Screen The PLAY screen comes up when you press 'RECALL'. The display shows:

- Current date and time (18-May-00 11:45:32)
- Saved message indicator (*)
- Message number (003)
- Status (Playing, Paused, Paused End)
- Speed of playback (range = 50% - 200%)
- Message date and time (18-May-00 09:11:23)
- Caller ID/DTMF (2016411200 ID)
- Message time length (00:05:11)

18-May-00 11:45:32	Msg #
*003/999	
Playing 100%	18-May-00
09:11:23	
2016411200 ID	Msg Len
00:05:11	
REWIND	FAST FWD PAUSE
DONE	

REWIND jumps back 1.25 seconds in the message and continues to play from that point forward; numerous presses move the time in the message back 1.25 seconds each press.

FAST FWD moves ahead 1.25 seconds in the message and continues to play from that point forward; numerous presses move the time in the message ahead 1.25 seconds each press.

PAUSE pauses the message at the time the key is pressed.

DONE allows the user to exit the PLAY screen and jump back into the MAIN screen.

Eventide Model DIR911 - Digital Instant Recall Operator's Manual

Introduction to the DIR911

The Eventide DIR911 is an instant recall recorder that takes telephone and/or auxiliary inputs and stores an incoming or outgoing audio message in digital memory, from which it is then immediately available for playback. The standard unit comes with approximately 64 minutes of audio storage, with an upgrade to 128 minutes of storage easily installed in the field. The unit offers the following features:

- Playback speed control, allowing the operator to play back the message up to 50% slower or 50% faster without any detectable change in audio pitch. This is invaluable for deciphering unintelligible messages
- Software controlled automatic gain control (AGC)
- Caller ID
- DTMF (Dual Tone Multi Frequency) tone detection
- Serial input/output ports for Automatic Location Identification (ALI), Automatic Number Identification (ANI), Remote Control, and external time synchronization
- Live monitor output with adjustable volume level
- Playback speaker and headphone jack with adjustable volume level
- Re-Record output with adjustable volume level
- Off hook detection
- External closure record activation
- Optional UPS (Uninterruptable Power Supply) giving 40 minutes of backup power (available from Eventide).

Typically, the DIR911 is used to record and then listen to an incoming or outgoing call immediately after the call has finished. In public safety applications, for example, when an operator receives a call, s/he may need to replay the call a few times, to make certain of the essential information before any action is taken. With the DIR911's adjustable speed control, the operator can speed up or slow down the message to make it intelligible (useful when the caller has been panicked and is inaudible at normal speed). In addition, the caller's phone number and location are available to the operator.

The information contained in this manual is for technical setup of the Eventide DIR911 unit.

For operational information, see the operator's Quick Reference Guide.

Initial Setup

UNPACKING THE UNIT

The Eventide DIR911 is shipped with a power supply (cable attached), an RJ-11 cable, this manual, and the Quick Reference Guide.

Connecting the Unit

(A) Power Supply

WARNING: Improper power supply connection can damage the DIR911 and can cause electric shock. For proper operation, use ONLY the power supply provided with the unit

Before applying power to the DIR911, make sure that the outlet into which you are plugging the power supply is a standard 110 VAC outlet. Any other voltage could damage the power supply and in turn damage the DIR911. Plug the mini-XLR locking connector from the power supply into the rear panel of the DIR911 first, then plug the power supply into the AC outlet.

(B) Telephone Line

The DIR911 has two RJ11 female connectors on the back panel. The phone line can be plugged into either; they are electrically connected together inside the DIR911. Both connectors are wired as follows:

Pin 2 is phone plug tip (pin 3 on 6 pin connector)
Pin 3 is phone plug ring (pin 4 on 6 pin connector)

Two connectors are provided should you need a loop-through line.

POWER-UP Screen

<p style="text-align: center;">EVENTIDE MODEL DIR 911 DIGITAL INSTANT RECALL SOFTWARE VERSION 1.00</p>
--

When power is first applied to the DIR911, the POWER UP screen displays momentarily. It gives you the model number and the current software version of the unit.

The MAIN screen comes up on the display automatically. This is where all operations begin.

Factory Default Settings

Time Source - <i>Internal</i>	Time Code Format - <i>0</i>
Auxiliary Channel Input Gain - <i>0.0 dB</i>	Auxiliary VOX threshold level - <i>+16 dB</i>
Auxiliary VOX hold time - <i>6 seconds</i>	
Telephone Channel Input Gain - <i>0.0 dB</i>	Telephone Record Activation - <i>VOX</i>
Telephone VOX threshold level - <i>+16 dB</i>	Telephone VOX hold time - <i>6 seconds</i>
Record priority - <i>Telephone takes priority</i>	Phone line beep tone - <i>Disabled</i>
Sampling - <i>32 kbps</i>	User password - <i>00000</i>
Security level - <i>High</i>	Call counter - <i>Cleared on power-up</i>
ANI source - <i>Internal caller ID</i>	
ALI phone number location - <i>Line #1 Column#1 Length 10</i>	
External time source IO port configuration - <i>19200 baud, 8 data bits, no parity, 1 stop bit</i>	
Caller ID/ANI IO port configuration - <i>19200 baud, 8 data bits, no parity, 1 stop bit</i>	
ALI IO port configuration - <i>19200 baud, 8 data bits, no parity, 1 stop bit</i>	
Remote control IO port configuration - <i>19200 baud, 8 data bits, no parity, 1 stop bit</i>	
Autorestore - <i>0.25 seconds</i>	
Traffic - <i>Light</i>	

Above is a list of those parameters that can be configured by the user, with the factory defaults. If the default settings are suitable for your application, you need only set the date and time and the (optional) password security feature and your unit will be ready to use. Instructions for changing the other setting are given below.

For the initial configuration of the unit, from the MAIN screen press the SYSTEM soft key.

SYSTEM Screen

```

Configuration, System Information
CONFIG      SYS INFO  DONE
  
```

SYS INFO Screen

```

Unit Serial Number: 911R00000
Current Firmware Version: 1.00
Memory Installed: 16 Megabytes
                        DONE
  
```

Press the SYS INFO soft key. The SYS INFO screen displays the unit serial number, the current firmware version, and the amount of memory installed. Press the DONE key to return to the SYSTEM screen.

Press the CONFIG soft key. The screen will ask for a password. Factory default is 00000, you can simply hit DONE. See below for setting a password of your own.

ENTER CONFIG/PASSWORD Screen - *Ignore at this time. See below for setting password*

Please enter your password:			
00000			
CURSOR	DECREASE	INCREASE	DONE

Simply press DONE to step to the CONFIG screen.

NOTE: The ENTER CONFIG/PASSWORD screen is bypassed when the unit security level is LOW.

CONFIG Screen - Leads to Clock and System Configuration

Configuring the DIR911		
CLOCK	SYSTEM	DONE

From this screen, you can configure the clock (setting the time and time source), and/or change the settings of the parameters listed above.

Time/Clock Configuration

CLOCK CONFIGURATION Screen - Leads to screens for setting date and time and the time source

DIR911 Clock Configuration		
SET TIME	SOURCE	DONE

Press the CLOCK soft key to access this screen. Here you can change the date and time and/or the source for keeping time in the DIR911. The DIR911 can synchronize externally to NENA Standard Time Code Formats 0, 1, or 2.

SET THE TIME Screen - Set the date and time

16-May-00 13:52:12			
CURSOR	DECREASE	INCREASE	DONE

Press the SET TIME soft key to display this screen. Here you can set the date and time for the DIR911. The CURSOR key moves activity from one quantity to the next; the INCREASE and DECREASE keys affect the value of the display. When finished, the DIR911 will prompt you to "SET" or "CANCEL" the new time. This prompt prevents accidental re-setting of the internal timer.

From the CLOCK CONFIGURATION Screen, press the SOURCE soft key to display this next screen.

TIME SOURCE Screen - *Change/View the time source , time code format, and last acquired external time*

Time Source: INTERNAL			Format: 0		
Last Acquired Time: 13-May-00			00:00:00		
CHANGE	FORMAT				DONE

Here you can set the DIR911 to synchronize to an external time source. The DIR911 accepts NENA Standard Time Code Formats 0, 1, or 2. (See Appendix A for actual data format 0, 1, and 2 information) The format can be changed by pressing the format key. The screen also displays the time that the last valid external time code signal was received.

NOTE: When set to INTERNAL time source, the unit ignores any external time code input. If the unit is set to EXTERNAL time source synchronization, then the external source takes priority, and the internal timer will update itself to the external time, even if you manually enter a new time.

Using the DIR911

If you have chosen to accept the factory defaults, have set the date and time, and have either set your own password or disabled the security feature (see CHANGING SECURITY LEVEL below), your unit is now ready for use.

16-May-00 11:45:32		Msg # 001/999	
Ready		01-Jan-89 00:00:00	
0000000000000000		Msg Len 00:00:00	
SYSTEM	PREV MSG	NEXT MSG	RESTORE

The MAIN screen is where all operations begin. From this screen, the user can record, play, cycle through messages, restore to current message, and check all saved messages.

PREV MSG (previous message) changes the current message to the one before and starts to play it.

NEXT MSG (next message) changes the current message to the next recorded message and starts to play it.

PREV MSG and NEXT MSG both automatically wrap when at the first or last message. Once you have skipped through and selected the message you wish to listen to, pressing the RECALL button moves you into the PLAY screen (see below).

RESTORE changes the current message to the last recorded message. *Note:* The unit will AUTORESTORE to the last recorded message after a set interval. Factory default is

0.25 seconds; this can be changed.

SYSTEM allows you to view system information and/or configure the DIR911.

The 'Ready' message on the display is the unit status. Unit status can be any of the following messages:

Ready - Ready to play/record
Recording - Unit is in record mode, recording a new message
Playing - Playing current message
Paused - Current message paused, play continues
Paused End - At the end of the current message

Recall - *Play, pause, rewind, fast forward*

16-May-00 11:45:32	Msg # *003/999
Playing 100%	16-May-00 09:11:23
2016411200 ID	Msg Len 00:05:11
PAUSE	REWIND
FAST FWD	DONE

The PLAY screen is the TOP screen. It comes up when you press 'RECALL'.

Above is a typical PLAY screen example. The display shows:

- Current date and time (07-Oct-97 11:45:32)
- Saved message indicator (*)
- Message number (003)
- Status (Playing, Paused, Paused End)
- Speed of playback (100%)
- Message date and time (07-Oct-97 09:11:23)
- Caller ID/DTMF (2016411200 ID)
- Message time length (00:05:11)

REWIND jumps back 1.25 seconds in the message and continues to play from that point forward; numerous presses move the time in the message back 1.25 seconds each press.

FAST FWD moves ahead 1.25 seconds in the message and continues to play from that point forward; numerous presses move the time in the message ahead 1.25 seconds each press.

PAUSE pauses the message at the time the key is pressed.

DONE allows the user to exit the PLAY screen and jump back into the MAIN screen. When the end of the playing message is reached, the *Paused End* message appears in the status location. The % value following the *Playing* status message tells the user the speed of the playback. The range of playback is from 50% (the slowest) to 200% (the

fastest); 100% is normal speed.

Note: If the DIR911 unit is in HEAVY TRAFFIC mode, the PLAY screen allows the user to switch between messages without having to return to the main screen.

16-May-00 11:45:32	Msg # *003/999
Playing 100%	16-May-00 09:11:23
2016411200 ID	Msg Len 00:05:11
PAUSE	REWIND
FAST FWD	DONE

Rear Panel Connection and Controls (See Figure(s) 2 and 4)

Telephone Line

Both connectors are wired as follows:

Pin 2 is phone plug tip (pin 3 on 6 pin connector)

Pin 3 is phone plug ring (pin 4 on 6 pin connector)

It does not matter which of the two jacks the phone line is plugged into; they are electrically connected together inside the DIR911. Two connectors are provided should you need a loop-through line.

Beep Adjust

This trim pot allows you to control the volume level of the beep tone injected onto the telephone interface line.

Off Hook Adjust

This trim pot allows you to control the off hook level of the telephone line.

Aux Audio In

A 3.5mm jack input for auxiliary audio input (e.g., two-way radio recording).

Port A (DB9 connector) Serial Input/Output used for Timesync & Remote Control

- Pin 1 - External Closure Contact Pin
- Pin 2 - RS-232 Remote control output (Tx)
- Pin 3 - RS-232 Remote control input (Rx)
- Pin 4 - No connect
- Pin 5 - GND
- Pin 6 - RS-485 positive data input (Rx+)
- Pin 7 - RS-485 negative data input (Rx-)
- Pin 8 - RS-485 positive data output (Tx+)
- Pin 9 - RS-485 negative data output (Tx-)

Port B (DB9 connector) Serial Input/Output used for Automatic Location Identification

(ALI)

Pin 1 - No connect
Pin 2 - RS-232 ALI output (Tx)
Pin 3 - RS-232 ALI input (Rx)
Pin 4 - No Connect
Pin 5 - GND
Pin 6 - No Connect
Pin 7 - No Connect
Pin 8 - No Connect
Pin 9 - No Connect

Port C (DB9 connector) Serial Input/Output used for Automatic Number Identification (ANI)

Pin 1 - No connect
Pin 2 - RS-232 ANI output (Tx)
Pin 3 - RS-232 ANI input (Rx)
Pin 4 - No Connect
Pin 5 - GND
Pin 6 - No Connect
Pin 7 - No Connect
Pin 8 - No Connect
Pin 9 - No Connect

Power/UPS On/Off switch

An on/off switch is used to turn the UPS (if installed) on and off. This can also be used as a power switch if modified by a certified Eventide technician.

Power Supply Input Mini-XLR

This 3-pin locking mini-XLR is connected to the power supply. Do not use any power source other than the unit supplied with the DIR911.

Front Panel Connections and Controls (See Figure(s) 1 and 3)

Speed Control

Used to control the speed of playback. Range is 50%-200% with a default of 100%. Turning the wheel to the left decreases the speed of playback, turning it to the right increases playback speed.

Soft Keys

There are four soft keys that perform the functions indicated on the fourth line of the display. These screen functions are explained in the "Menu & Configuration Screens" section of this manual.

Save Key

Used to save or unsave a given message. When a message is recorded and the user

does not want this message to be erased, s/he can “save” the message (indicated by an asterisk * next to the message number). It will be stored in a separate section of memory reserved for this purpose. If the user wants to cancel the save, s/he simply presses the “Save” key again. The * will disappear and the message can now be recorded over as new messages come in.

Recall Key

Used to play back a given message. At any point in a given message (except at the end), the user can press the Recall key and that message will play back from the beginning again.

Monitor Output and Adjustment

A “live” mixed output of the incoming audio to the DIR911. The mixed audio is a combination of the telephone and auxiliary inputs. The adjustment trim pot allows the user to set the volume level of this output.

Phones and Volume Adjustment

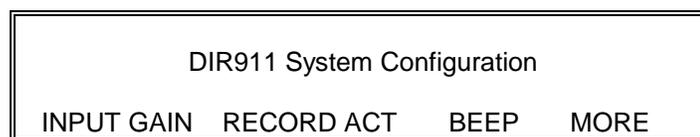

The playback output for the selected message recorded by the DIR911. If there are no headphones plugged into the Phones jack socket, then playback audio comes through the speaker. The large volume knob allows the user to control the volume level of this output, whether to the speaker or through headphones.

Re-Record Output and Adjustment

The playback output of the selected message in the DIR911, designed to plug into an external tape machine or headphones. The adjustment trim pot allows the user to set the volume level of this output.

System Configuration

CONFIG 1 Screen - *Leads to Change/View Telephone/Auxiliary channel input gain, recording level activation, test record activation, set record priority, and telephone line beep configuration*

Using configuration screen 1, you can configure/change/review the telephone and auxiliary channel input gain, the telephone record activation, off hook, vox, and external closure record level test and adjustment, set recording priority, and set the phone line beep to an appropriate level if desired. “MORE” leads to the Config 2 screen.

TELEPHONE/AUXILIARY INPUT GAIN Screen - *Change the gain of the telephone and/or auxiliary input*

Telephone Input Gain: 0.0dB			
Auxiliary Input Gain: 0.0dB			
CURSOR	DECREASE	INCREASE	DONE

If you want to “boost” the strength of the input signal of either the telephone or auxiliary inputs, the input gain for the appropriate channel can be changed here. As the number is increased from 0.0dB (the default value), it acts like an input volume control; the higher the input gain, the higher the input signal volume. The range of input gain of both channels is 0.0dB-22.5dB in increments of 1.5dB. The “CURSOR” key moves from telephone gain adjustment to auxiliary gain adjustment or vice versa. It is important to note that if the record activation is set to VOX, the higher the input gain, the more sensitive the VOX detection becomes.

RECORD ACTIVATION Screen - *Leads to set record activation, test/adjust activation level, and set record priority.*

Configure record settings and priority			
ACTIVATION	LEVEL ADJ	PRIORITY	DONE

From this screen, you can set the type of input to be used to trigger recording activation, set the input record level, and set the record priority.

SET RECORD ACTIVATION Screen - *Set the record activation to VOX, Off Hook, or External closure*

Record Activation by: VOX	
CHANGE	DONE

From this screen, you can select the type of record activation to use on the telephone line input (the auxiliary input uses VOX activation only). There are three ways of triggering the DIR911 to start recording:

1. VOX, using the input audio level crossing a given threshold level,
2. Off hook, using the off-hook voltage on an active telephone line, and
3. External contact closure, using an external switch closure.

“CHANGE” steps through these choices. Press “DONE” to select.

TEST/ADJUST RECORD ACTIVATION LEVEL Screen - *Leads to set Ext. Closure, Off Hook, and VOX level adjustment and test screen*

Test input record levels			
EXT CLOSE	OFF HOOK	VOX	DONE

Here you can adjust and/or test the type of record activation used on the telephone line input. All three methods of activation can be tested here, as explained in the following screens.

TEST EXTERNAL CLOSURE ACTIVATION Screen - *Test the external contact closure*

Close contact to test record activity	
External Closure Record: DISABLED	
Use Port A pin 1 closure, pin 5 GND	
	DONE

First, make sure that the external closure pins are connected. Port A pin 1 should be connected to the dry contact closure and the ground should be connected to Port A pin 5. Close and open the contact. The display should read ENABLED when the contact is closed (grounded) and DISABLED when the contact is open.

TEST/ADJUST OFF HOOK ACTIVATION Screen - *Test/adjust the off hook record level*

<p>Adjustment on back of unit sets on/off hook record level Phone is currently: ON HOOK</p> <p style="text-align: right;">DONE</p>
--

First, make sure that the phone is on the hook and the display reads "ON HOOK." If it does not, adjust the trim pot labeled "Off Hook Adjust" (on the back of the unit) until the display reads "ON HOOK." When you lift the phone off the hook, the display should say "OFF HOOK." If it does not, adjust the same trim pot until the display reads "OFF HOOK." You may need to lift the phone on and off the hook a few times to check this setting.

VOX RECORD ACTIVATION Screen - *Leads to Test/adjust of VOX record level and hold time*

<p>Set VOX record level and hold time</p> <p>LEVEL HOLD TIME DONE</p>

This screen leads to screens that allow you to edit the VOX record level and hold time for both the telephone and auxiliary channels.

TEST/ADJUST VOX RECORD ACTIVATION Screen - *Test/adjust the VOX record level*

<p>Tele VOX lvl: +16 dB Record: DISABLED Aux VOX lvl: +16 dB Record: DISABLED Adjust here to set active record level</p> <p>CURSOR DECREASE INCREASE DONE</p>
--

You will need access to the phone or auxiliary input device used with the DIR911 for proper VOX level adjustment. The VOX threshold level (in decibels) is the level that the incoming signal needs to surpass to activate recording. Obviously, as the VOX level number increases, the volume of the incoming signal needed to activate recording will be higher. To test the setting, just talk into the phone or auxiliary input. At normal volume levels, the RECORD message should read ENABLED. If not, then lower the VOX level number until normal volume produces the message ENABLED.

If the setting is too sensitive (i.e., recording ENABLED when there is no signal), then raise the threshold level until the message reads DISABLED.

The range of threshold settings is 0dB-42dB, with a default setting of 16dB on both inputs.

The "CURSOR" key toggles between telephone and auxiliary adjustment. The

“DECREASE” and “INCREASE” keys adjust the VOX level accordingly. Press “DONE” to select the value displayed.

SET VOX HOLD TIME Screen - *Set the VOX signal hold time*

Telephone VOX hold time: 6.0 seconds			
Auxiliary VOX hold time: 6.0 seconds			
CURSOR	DECREASE	INCREASE	DONE

The VOX hold time is the length of time that the unit will continue to record after a loss of input signal. For example, if an incoming caller puts the user on hold and the VOX hold time is set to 8 seconds, then the unit will continue to record for a minimum of 8 seconds while there is no signal present.

The range of hold time settings is 2.0 seconds to 12 seconds, with a default setting of 6.0 seconds on both inputs.

The “CURSOR” key toggles between telephone and auxiliary adjustment. The “DECREASE” and “INCREASE” keys adjust the VOX hold time accordingly. Press “DONE” to select the value displayed.

SET RECORDING PRIORITY Screen - *Set the recording priority to telephone, auxiliary, or both*

Set recording priority level here:	
Telephone takes priority	
CHANGE	DONE

Although the DIR911 can accept both a telephone and an auxiliary input, it can only record one or a mix of both at a given time. Here you can set recording priority, i.e., if there is input from both sources, which takes precedence. If the telephone line is usually more important and the auxiliary input is connected to a radio that is usually less important, then using recording priority as shown above, the telephone call will be recorded instead of the radio call. The choices are Telephone takes priority, Auxiliary takes priority, and Neither takes priority, mix together, which sets no priority but mixes the two signals together in one message.

BEEP CONFIGURATION Screen - *Enable/Disable beep, set level of beep tone on telephone line*

The beep is currently: DISABLED		
CHANGE	CONSTANT	DONE

This is the beep configuration screen. A 1kHz beep tone can be injected on the phone line to let the user and others know that they are being recorded. "CHANGE" steps between enabled and disabled.

When the CONSTANT key is activated, a constant beep tone is added to the telephone input signal. This allows you to set the volume level of the beep as compared to the level of the incoming signal. The constant tone is used only for adjusting the beep signal level. The "Beep Adjust" trim pot on the back panel of the DIR911 allows you to set the level of the beep tone on the recording. After completing beep level adjustment, then press "STOP" and set the beep enabled or disabled. Check it by plugging a set of headphones into the Monitor jack. The default beep setting is DISABLED.

CONFIG 2 Screen - *Leads to Change/View sampling rate, security configuration, and message information*

DIR911 System Configuration			
SAMPLING	SECURITY	MSG INFO	MORE

Using configuration screen 2, you can configure/change/review the sampling rate, security configuration including password configuration and security level, and message information. "MORE" leads to the Config 3 screen.

SAMPLING Screen - *Changing the sampling/transcoding rate*

Transcoding Rate: 32 kbps	
CHANGE	DONE

As of current version, there is only one transcoding rate available, 32kbps. Eventide plans to add 64kbps at a later date. With the standard 16MB of DRAM, 64 minutes is available for recording at 32kbps, and 32 minutes is available at 64kbps. With an additional 16MB (total of 32) of DRAM 128 minutes is available for recording at 32kbps, and 64 minutes is available at 64kbps.

IMPORTANT NOTE: If you change the transcoding rate, the unit is effectively "reset" and all message audio and information is cleared.

MESSAGE INFORMATION Screen - *Leads to Change/View message information*

Call Counter and Message Information		
TOTAL	CALL CNT	DONE

From the message information screen, you can look at information on all messages. You can view time and number of messages recorded, time and number of messages saved, time available for recording, and a 100000 call counter. You can also reset all message information.

Pressing "TOTAL" leads the user into the message times screen explained in the TOTAL MESSAGE TIMES Screen section.

"CALL CNT" leads the user into the call counter screen explained under CALL COUNTER Screen.

TOTAL MESSAGE TIMES Screen - *View total messages and message time information*

Recorded Msgs: 000	Time: 00:00:00	
Saved Messages: 000	Time: 00:00:00	
Available Recording	Time: 01:01:26	
ERASE ALL		DONE

Here you can see the number of recorded messages and the corresponding total time, the number of saved messages and the corresponding total times, and the available recording time.

The Recorded Messages information includes all messages recorded, including saved and not saved. The Saved Messages time includes only saved messages and their corresponding times.

If "ERASE ALL" is pressed, the DIR911 will ask you if you are sure you want to erase all messages and reset them all. Simply press "YES" to reset and "NO" to keep the existing messages. All messages and corresponding information will be deleted and the message number will be reset to 1. **This includes all "saved" messages. The entire message buffer is erased.** However, THIS DOES NOT AFFECT THE CALL COUNTER. The only way to reset the call counter is from the "Call Counter" screen.

CALL COUNTER Screen - *Reset/View call counter*

The total # of calls received since 1-Jan-00 00:00:00 is 000000 Press RESET CNT to reset	
RESET CNT	DONE

Here you can see how many calls have been received by this particular DIR911 since the unit was powered on or since the last call counter reset, whichever is the more recent. This feature can be used to analyze the activity of a given operator over a period of time, to check the number of calls a given location makes and receives in a given day, etc.

By pressing "RESET CNT," you will reset the call counter to 0 and start it up again.

Security Configuration

The following screens are used when setting up the security in the DIR911. Security can be set to a high level, under which all configuration menus are password-protected. Factory default is "high," default password is 00000.

SECURITY Screen - *Leads to changing password/security level*

DIR911 Security Configuration		
CHANGE PWD	LEVEL	DONE

From this screen, you can change your password and the security level of the unit.

CHANGING THE PASSWORD Screen - *Change your current password*

Please enter your current password:			
00000			
CURSOR	DECREASE	INCREASE	DONE

If you wish to change your security password, then enter the screen above by pressing "CHANGE PWD" in the SECURITY screen. The factory default password is 00000, which displays automatically. Press DONE.

The next screen asks for your new password. Enter your new password by moving from digit to digit with the cursor and using DECREASE/INCREASE on each digit. Press DONE when your new password is complete.

The next screen asks you to verify this new password by entering it again. Enter as above, and press DONE. The unit will notify you if the password change has been successful or if there was an error. If an error occurs, simply enter the current valid password and follow the procedure again.

CHANGING SECURITY LEVEL Screen - *Change the security level*

Current Security Level: HIGH SECURITY	
CHANGE	DONE

There are two levels of security available in the DIR911: HIGH and LOW. If the DIR911 is set to low security, there is no password protection. If it is set to high security, you can only edit the DIR911 configuration information by entering your password. High security is most useful when only one person (e.g., a supervisor) should have access to the DIR911 configuration and operators are not permitted to change any settings. High security is the factory default setting.

CONFIG 3 Screen - *Configure Serial Input/Output, ANI and ALI configuration, field firmware upgrade, select Traffic (light or heavy), and Autorestore time.*

DIR911 System Configuration			
SERIAL I/O	TRAFFIC	AUTORESTORE	DONE

Press "SERIAL I/O" and jump into the configuration screen. Press "TRAFFIC" to select LIGHT or HEAVY traffic(default is LIGHT). Press AUTORESTORE to change timing on Autorestore feature (default is 0.25 seconds).. Press "DONE" when DIR911 configuration is complete.

CONFIGURE IO Screen

Configure IO port, Serial data info		
CONFIG	MORE	DONE

Press "CONFIG" to set up the serial IO communication rates for all four serial ports. "MORE" leads to the ANI/ALI, field upgrade menu and "DONE" leaves the IO configuration screens.

PORT CONFIG Screen - *Configure Serial Input/Output Port*

External Time Sync IO Port (RS-485)			
Rate:19200 Parity:None Data:8 Stop:1			
Port A	Out+ P8	Out- P9	In+ P6 In- P7
PORT	CURSOR	CHANGE	DONE

Here, the serial IO communication rate can be configured. Pressing “CURSOR” jumps from quantity to quantity; “CHANGE” changes the value of the quantity where the cursor is; and “PORT” changes the current port being configured. There are four ports available for configuration:

- External Time Sync
- Caller ID/ANI
- ALI - Automatic Location ID
- Remote Control

The available settings are as follows:

- Baud rates: 300, 1200, 4800, 9600, 19200
- Parity settings: None, Odd, Even
- Data bits: 7 or 8
- Stop bits: 1 or 2.

Included on this screen are the pin-outs for each of the port pins and the type of serial communication (i.e., RS-232 or RS-485). Press “DONE” when finished.

ANI/ALI UPGRADE Screen - *Configure ANI and ALI, field firmware upgrade*

Upgrade the unit firmware			
Choose where number input from, location			
WHERE ANI	SETUP ALI	UPGRADE	DONE

“WHERE ANI” changes where the phone number for an incoming call is received. There first choice is Internal Caller ID, which gets the caller identification number from the phone company directly on the phone line. This is the default setting and should be used unless a different source supplies the DIR911 with a serial phone identification stream.

The second choice is “Extract from serial ALI stream Port B”. Using this setting, the DIR911 must be supplied with a standard 16 line x 32 column ALI data input. If this is chosen, then the “SETUP ALI” key should be pressed. This allows the user to set the line number, column where the phone number starts, and the length of the phone number in the ALI data field (See SETUP ALI Screen below).

The third choice is “Extract from serial ANI stream Port C”. Using this setting, the DIR911 must be supplied with a serial phone data input via serial port C. ANI is supported via a serial port ONLY!!

SETUP ALI Screen - *Set up where in the ALI data field to extract the calling party's phone number*

Line #: 01	Column #: 01	Length: 10
Set the location in the ALI data stream to correspond to the incoming phone #		
LINE	COLUMN	LENGTH DONE

When ALI data are available, the DIR911 can extract the telephone number identification of the calling party from these data. You will need to set the line #, column #, and the length of the incoming caller's phone number. Here is an example of ALI data and how you would set those three quantities:

```

WARNING-LINE
201-641-1200  HH:MM:SS MM/DD/YY
CITIZEN'S NAME
STRNUM TRL PRE STREET NAME
STREET NAME CONT D      SUFX DIR
MAP COORDINATE
COMMUNITY                      ST
BUILDING ID
UNIT          FLR              CLAS

PILOT # NPA-NXX-XXXX  ESN
PSAP IDENTITY
LAW          NPA-XXX-XXXX
FIRE        NPA-XXX-XXXX
EMS         NPA-XXX-XXXX
CF # NPA-XXX-XXXX    LEC

```

If the ALI data received by the DIR911 are in the above form, set the line number to 2 for the 2nd line, the column number to 1 for the 1st char of the 2nd line, and set the length to 12 for all numbers including the dashes, e.g., 201-641-1200. The dashes **MUST** be included in the length of the number so the entire number can be scanned by the DIR911.

NOTE: The format of ALI data changes from state to state, and sometimes from county to county. You will need to verify the format for your particular location.

The DIR911 will extract the calling party's number when receiving ALI even if the unit does not have the extra memory option installed. However, these data will **NOT** be stored in the DIR911 system memory and will not be available on playback. The extra memory option **MUST BE INSTALLED FOR FULL ALI DATA SUPPORT.**

UPGRADE Screen - Field firmware upgrade

You must LOAD the new firmware first		
SAVE next to save in ROM version		
DO NOT PRESS UNTIL UPGRADE PREPARED		
LOAD	SAVE	QUIT

The DIR911 firmware can be upgraded in the field provided that you have a computer with a serial download program. The upgrade process is a two-step process, which

ensures that the correct version of firmware is saved so that, if an error occurs, the DIR911 can re-load this previous version and continue operation.

Connect the computer carrying the new firmware upgrade to Port A of the DIR911. The serial IO configuration of the computer must match the remote control port IO for this to operate properly. When this is done, press "LOAD" and the LOAD UPGRADE screen shown below will appear.

LOAD UPGRADE Screen - Load field firmware upgrade from computer

System firmware load started Please wait for reboot... If X appears on bottom line, error Progress:
--

This screen waits for the data transfer from the external computer to begin. Once the loading has started, the progress indicator will continue until it reaches just about the end of the line. If an X appears in the progress indicator, an error has occurred and new firmware has not been successfully loaded. When the upgrade is successfully loaded, the unit will reboot with the new firmware version. However, this new version must now be saved to system ROM. Get back to the UPGRADE screen and press "SAVE". The following screen will appear:

SAVE UPGRADE Screen - Save field firmware upgrade to ROM

Press BURN to save new ROM firmware	
BURN ROM	DO NOTHING

Assuming the upgrade has loaded successfully, press "BURN ROM" to save the new upgrade code as permanent. The following message should appear on the display "Burning ROM with new code version Will reboot when upgrade complete". After the upgrade is saved to ROM and the system reboots, the upgrade is complete. If you do not want the upgrade, simply press "DO NOTHING" and power the unit off and on again. This will load the older firmware version and the upgraded version will not be used.

TRAFFIC Screen - Switch between LIGHT or HEAVY traffic

This DIR911 has: HEAVY TRAFFIC Heavy traffic allows user to jump from message to message in Recall mode	
CHANGE	DONE

In LIGHT traffic mode, user can move about in the selected message by pressing Recall and moving to the PLAY screen, but must return to the main screen to get to another message.

In HEAVY traffic mode, user can move to the next message directly from the PLAY screen.

07-Oct-97 11:45:32	Msg # *003/999		
Playing 100%	15-May-00 09:11:23		
2016411200 ID	Msg Len 00:05:11		
PAUSE	REWIND	NEXT MSG	DONE

AUTORESTORE Screen - Change the time after which unit reverts to the last message

Autorestore time:0.25 seconds		
DECREASE	INCREASE	DONE

The Autorestore interval can be set from 0.25 seconds (factory default) to 60 seconds.

Appendix A - DIR911 Accepted External Time Source Protocols

The **DIR911** will synchronize to the NENA RS-485 standard time code formats 0, 1, or 2. Here are the formats and what the characters mean:

The Eventide **ECW-40** supports the following RS-232/485 protocols.

FORMAT 0 - <CR><LF>I<^><^>DDD<^>HH:MM:SS<^>DTZ=XX<CR><LF>

KEY:

<CR>	Carriage return
<LF>	Line feed
<I>	Sync Status: ^ = sync; ? = sync lost; * = Manual Set
<^>	Space
<DDD>	Day of Year (001-366)
<HH:MM:SS>	Hours:Minutes:Seconds
<D>	Daylight saving indicator (S,I,D,O)
<XX>	Time Zone Setting (00-23)

FORMAT 1 - <CR><LF>I<^>WWW<^>DDMMYY<^>HH:MM:SS<CR><LF>

KEY:

<CR>	Carriage return
<LF>	Line feed
<I>	Sync Status: ^ = sync; ? = sync lost; * = Manual Set
<^>	Space
<WWW>	Day of week: SUN MON TUE WED THU FRI SAT
<DD>	Numerical day of month, 1-31
<MMM>	JAN FEB MAR APR MAY JUN JUL AUG SEP OCT NOV DEC
<YY>	Year, 00-99
<HH:MM:SS>	Hours:Minutes:Seconds

FORMAT 2 - <CR><LF>IQYY<^>DDD<^>HH:MM:SS.XXX<^>LD

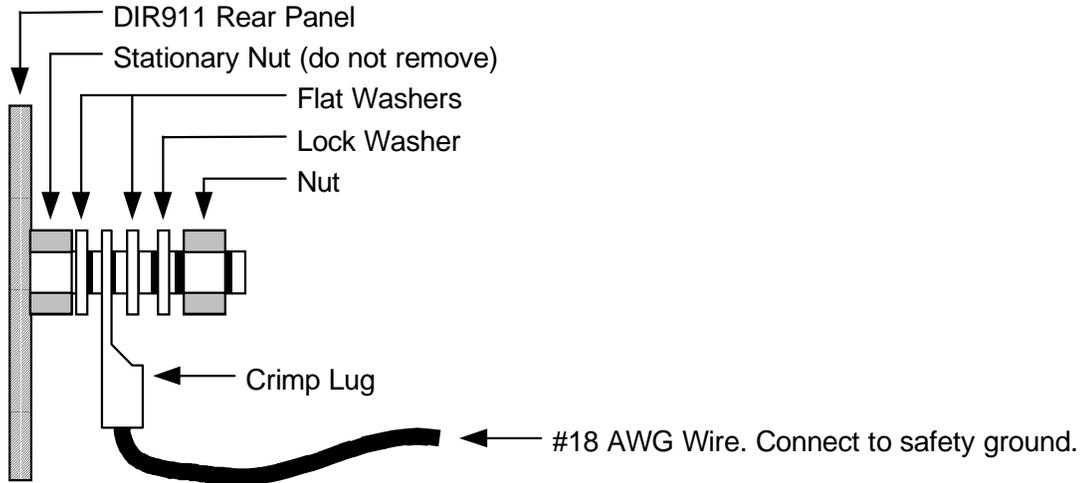

KEY:

<CR>	Carriage return
<LF>	Line feed
<I>	Sync Status: ^ = sync; ? = sync lost; * = Manual Set
<Q>	Quality (^,A,B,C,D) [^<1 A<10 B<100 C<500 D<500ms]
<YY>	Year, 00-99
<^>	Space
<DDD>	Day of Year (001-366)
<HH:MM:SS>	Hours:Minutes:Seconds
<.>	Decimal Separator
<XXX>	Milliseconds
<L>	Leap second indicator
<D>	Daylight savings indicator (S,I,D,O)

NOTE: The DIR911 will NOT synchronize to any time source where the sync status is NOT set to a SPACE. In other words, the DIR911 will only synchronize its internal clock to an external time source when the external time source is synchronized to valid time.

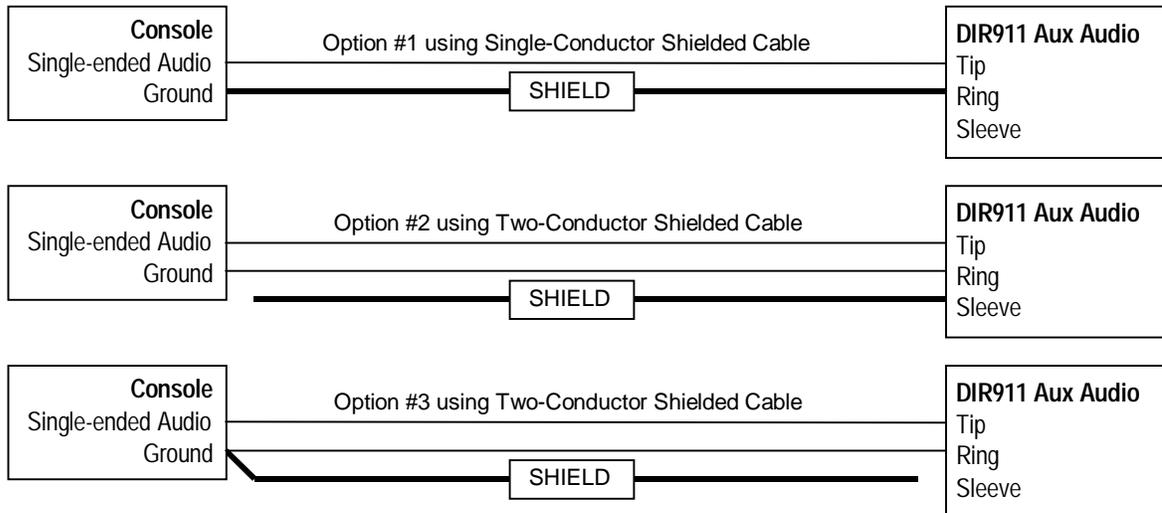

Appendix B: Chassis Grounding

All new DIR911s now include a grounding stud on the rear panel. A grounding hardware kit shipped with each unit includes one #10 nut, one lock washer, two flat washers, and one crimp lug. It is recommended that a ground wire (#18 AWG) be connected between the DIR911 and safety ground.

Appendix C: Auxiliary Audio Input Connections

It is recommended that there be no direct ground connection between the console and the DIR911. The DIR911's Aux Audio input uses a transformerless balanced circuit, and should be wired in one of three ways:

Appendix D - FCC Part 68 Telecommunications Statement

This device complies with Part 68 of the Federal Communications Commission (FCC) rules. On the rear surface of this device is a label that contains the FCC registration number and the ringer equivalence number (REN) for this device. If requested, this information must be provided to the telephone company.

The USOC jack required is RJ-11C (standard modular jack). Plugs and jacks used to connect this device to the telephone network must be compliant with the FCC Part 68 rules.

The REN is used to determine how many devices can be connected to your telephone line. In most cases, the sum of the RENs of all devices connected to a telephone line should not exceed five (5.0). If too many devices are connected, they may not respond properly to incoming calls.

If this device causes harm to the telephone network, the telephone company may temporarily discontinue service. The telephone company will attempt to notify you before discontinuing service, but if this is not practical you will be notified as soon as possible. You will be advised of your right to file a complaint with the FCC.

The telephone company may make changes in its facilities, equipment, operations, or procedures that could affect the operation of this device. The telephone company will provide advanced notice of any such changes so that you can make the necessary modifications to maintain uninterrupted service.

If you experience trouble with this device, contact Eventide for warranty or repair information:

Eventide Inc., One Alsan Way, Little Ferry, NJ 07643 (201) 641-1200

If the device causes harm to the telephone network, the telephone company may ask that it be disconnected until the problem is resolved.

This device cannot be used on public coin phone service provided by the telephone company. Connection to party lines is subject to state tariffs.
