

OCTAVOX™

HARMONIZER®

Octavox features the pitch shifting technology derived from our flagship processor Orville™, and wraps it in a professional plug-in inspired by decades of music-making. The unique Notation Grid™ allows you to create harmonies and complex musical sequences by dragging notes in a graphic "notation meets step sequencer" window. Micro pitch shifting is also possible for lush detune effects and vocal thickening. With an uncluttered and easy to use interface, Octavox offers up to 8 voices of time-based diatonic pitch shifting for Pro Tools™ TDM.

REVERB

Reverb brings the best of Eventide's reverb algorithms from the DSP4000, Eclipse™, and Orville™ hardware boxes to Pro Tools® TDM. Offering the complete range, Reverb allows you to create anything from tiny spaces to outer spaces with just a few mouse moves. Pre and post parametric equalizers, a high-quality compressor, dual delays, and a bit reducer give you unprecedented sonic flexibility. An easy-to-use interface stays out of the way of creativity while the unique Snapshot feature provides one-click recall of the entire plug-in. Simply the best of the best, these reverbs are derived from Eventide's top-of-the-line hardware processors used by engineers and producers worldwide on top recording projects.

H3000 BAND DELAYS™

The venerable H3000 lives on in the Band Delays™ plug-in from Eventide. Derived from the original filtered delay algorithm found only in this legendary processor, Band Delays broadens the landscape with eight voices of tempo-based filtered delays. Filters can achieve high resonance and are selectable low-pass, high-pass, band-pass and notch. Delays offer full tempo support including an intuitive Beat Grid for creating pulsing rhythms.
